Import Method

☒ **Batch** Batch mode is recommended for faster processing. When clients have matched payors previously or submitted a batch of claims containing the payors ID's in the files, it is unnecessary to halt the entire batch, match the unmatched payors, then continue processing the claims.

☐ **Interactive** Interactive mode pauses for user interactive payor matching prior to processing the claims. The claim files will go into a Pending Processes queue (only when new payors are encountered). By selecting Pending Processes under the Processing Center Tab, a pending batch may be selected so that the payor matching procedure can occur. Once payor matching is complete, the batch will continue to process. Interactive mode is recommended for clients who encounter a large number of new payors with every claim submission. This might be the case for the first 30 days of claims processing. It is then recommended that the client switch to Batch mode processing.

Auto Populate Tables

☒ Physician Master

☒ Facility Master

Update Profile

The Processing Profile screen allows a user to select or deselect processing options. Batch mode processes all claims and rejects the claims with unmatched payors. Interactive mode allows a user to match payors which do not correspond to a payor ID, prior to processing the claims and receiving a file number and processing status. Auto-Populate Table enters new physician data and facility data into the appropriate tables automatically if the claim file contains the data for these fields.
